11. Deploying Zoho Creator App to Production

Aim

To understand and execute the deployment lifecycle of a Zoho Creator application, moving components from the sandboxed Development Environment to the Live Production Environment safely and efficiently. The application deployed is **Vehicle Service Lab**.

Overview

Zoho Creator provides distinct environments to separate application building and testing from live user operations. Proper deployment ensures data integrity and seamless release management.

Environment	Purpose and operational rules
Development (Sandbox)	Used for building forms, writing Deluge scripts, and testing features without impacting live data.
Production (Live)	The live environment accessed by end-users, containing active transactional data and strict access controls.
Migration & Publish	The controlled process of pushing schema changes, workflows, and configurations from Dev to Prod.

Procedure

1. Pre-deployment validation: open the tested Vehicle Service Lab application in the Zoho Creator development workspace and check that the form, reports, dashboard, Deluge scripts and workflows work.

2. Open **Environments** under Deploy in the Creator home page. The page lists the application in the development column, with **Stage** and **Production** columns beside it.

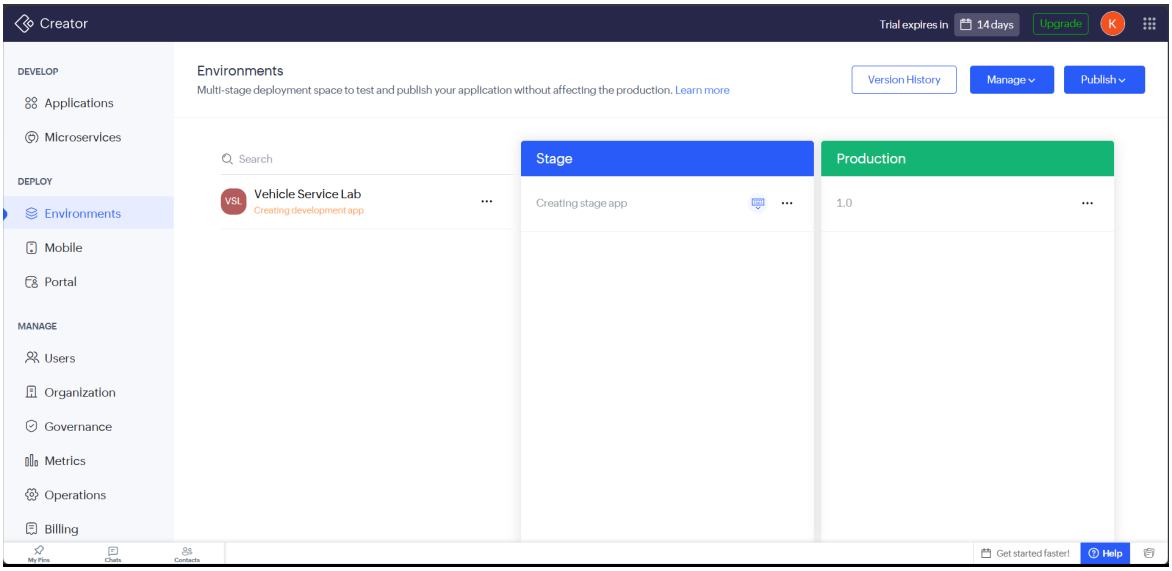

3. Add the application to the environment: use **Manage** and select **Add applications to environment**, then choose Vehicle Service Lab with **Select Applications**.

4. Initiate migration: open **Publish** and choose **Publish to Stage** to create the stage copy of the application, then **Publish to Production** to release it to the live environment.

5. Review the schema and component differences that Zoho Creator reports (new forms, modified fields, updated scripts) before each publish, and check the version history (**Version History**) afterwards.

Environments page with Vehicle Service Lab in the development column and the Stage and Production columns; the stage application is being created.

Figure 2: Add applications to environment

Dialog for adding an application to the environment, with the Select Applications button.

Figure 3: Version 1.0 in Stage and Production, with the Publish options

Version 1.0 (13 Oct 2026) shown in both the Stage and Production columns, and the Publish menu offering Publish to Stage and Publish to Production.

Result:

The Vehicle Service Lab application was moved from the development environment to Stage and Production (version 1.0) in Zoho Creator, demonstrating the transition lifecycle of a low-code application and the use of separate environments for safe release management.
