Experiment No. 5

Reports, Dashboards, and UI Builder

1. Aim and Objective

To build the reports, the dashboard and a single internal **Service_Command_Center_Page** for the Zoho Creator application *Vehicle Service*, and to demonstrate all eleven Page Builder elements: **Panel, Board, Chart, Gauge, Search, Form, Report, Snippets, Button, Widgets** and **Viewer**. The aim is to give front-office staff, technicians and the service center manager one workspace to monitor, search, process and reference service requests.

Before this page, staff checked status in the default report, with no visual sense of bay occupancy, no quick vehicle search, no drag-and-drop stage movement and no single place to see insurance or damage photos. They switched between reports, a paper job-card register and shared folders to process a single vehicle.

2. Page Elements and Mapping

Element	Element name	Purpose	Placement
Panel	Command_Center_Main_Panel	Outer container grouping all elements; role-based visibility	Wraps the entire page
Board	Service_Status_Board	Kanban board; dragging a card updates the Status field	Central column
Chart	ServiceType_Distribution_Chart_Widget	Pie chart of requests per service type; auto-refresh	Top right, next to Gauge
Gauge	Daily_Bay_Utilization_Gauge	Circular gauge of occupied bays (e.g. 6 of 8)	Top left
Search	Vehicle_Owner_Search_Bar	Search by registration number, owner name, request ID	Top, above the Board
Form	Quick_Walkin_Service_Form	Embeds the service request form for walk-ins	Right panel, expandable tab
Report	Full_Service_Requests_Report	Full report for row-level review and export	Below the Board
Snippets	Service_Policy_Estimate_Snippet	Reusable service policy and estimate terms	Sidebar
Button	Send_ReadyForPickup_Button	Notifies owners whose vehicles are Ready for Pickup	Above the Board
Widgets	Technician_And_SpareParts_Stock_Widgets	Technician availability and spare-parts stock	Bottom strip
Viewer	Insurance_Damage_Photo_Viewer	Inline viewer for insurance copy and damage photos	Sidebar, below Snippet

3. Application Forms and Reports

The Command Center reads from the Service Requests form and its reports. The screenshots in this section were captured from the live application and show the data the page elements work on.

3.1 Service Requests form

The form captures the owner name, vehicle type, vehicle number, service type, customer email, contact number, status, service date and pickup address, followed by the odometer reading, vehicle damage photo, pickup/drop option, estimated service cost, discount percent, owner digital signature and submission time. The Quick Walk-in Form element reuses this form, so the same validation applies at every entry point.

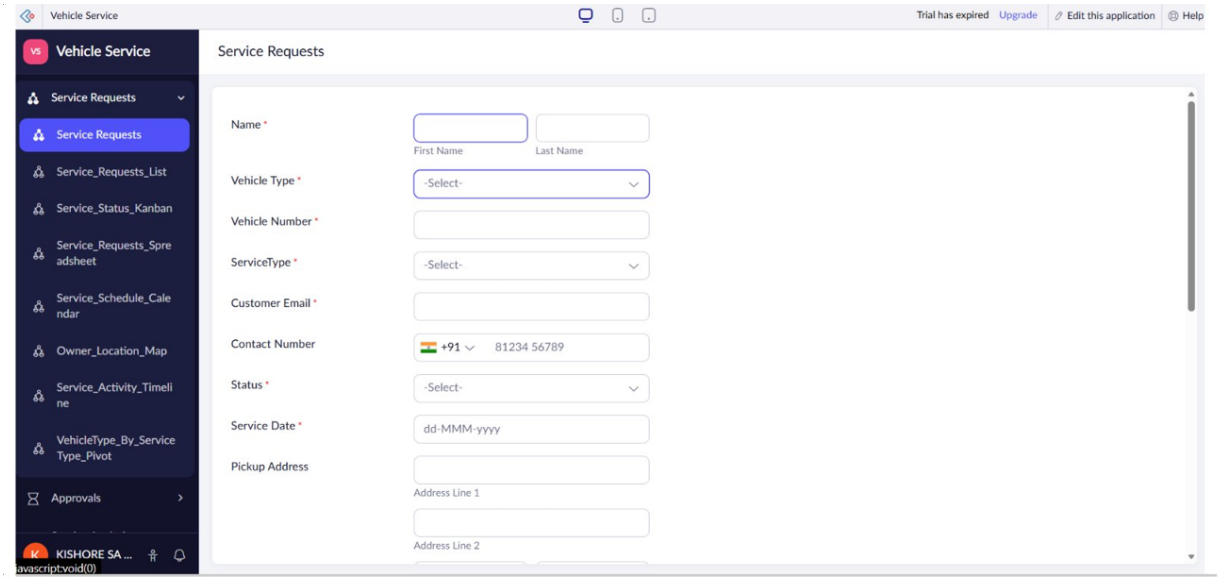

Figure 1: Service Requests form, owner, vehicle, status and service date fields

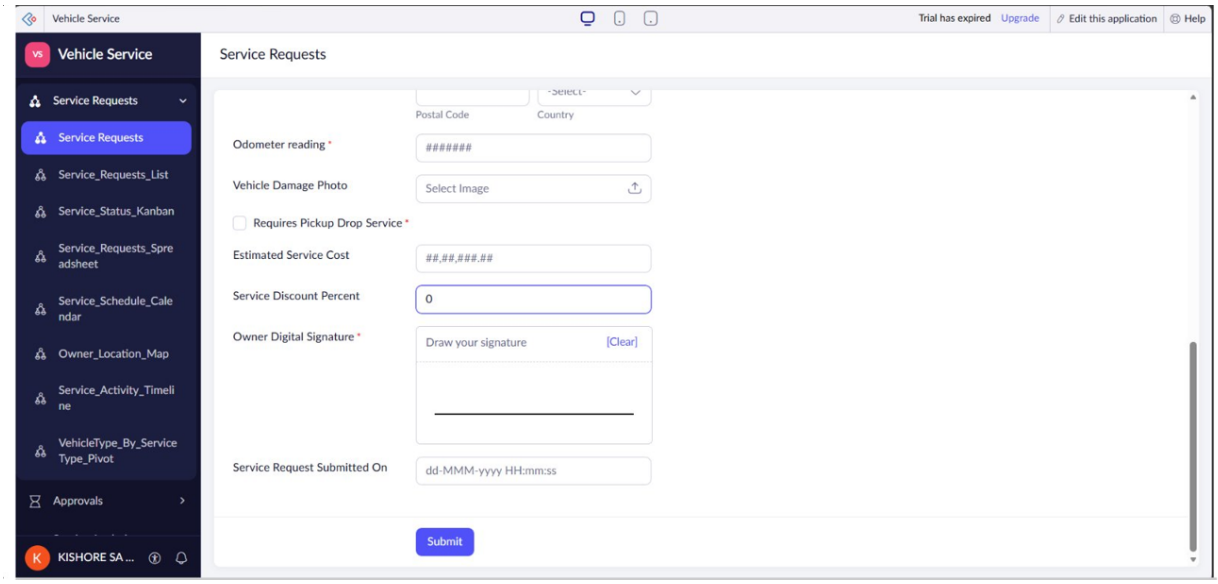

Figure 2: Service Requests form, odometer, damage photo, cost, discount and signature fields

3.2 Service_Requests_List

The list report shows five service requests with vehicle type, vehicle number, service type, customer email, contact number and status. Madison Beer (Repair) and Liam Johnson (Inspection) are In Progress, Noah Davis (Inspection) is Pending, and Olivia Smith (Washing) and Ethan Walker (Oil Change) are Completed. This is the data source for the Full_Service_Requests_Report element.

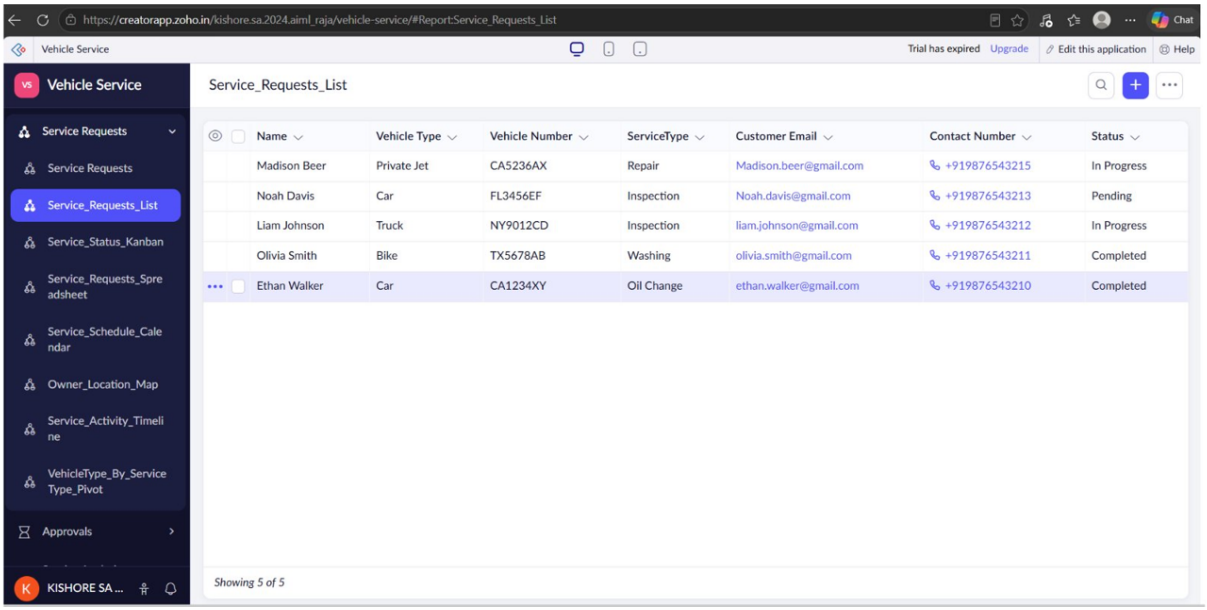

Figure 3: Service_Requests_List report

3.3 Service_Requests_Spreadsheet

The spreadsheet report allows inline editing of the same records in a grid, which suits quick corrections by front-office staff.

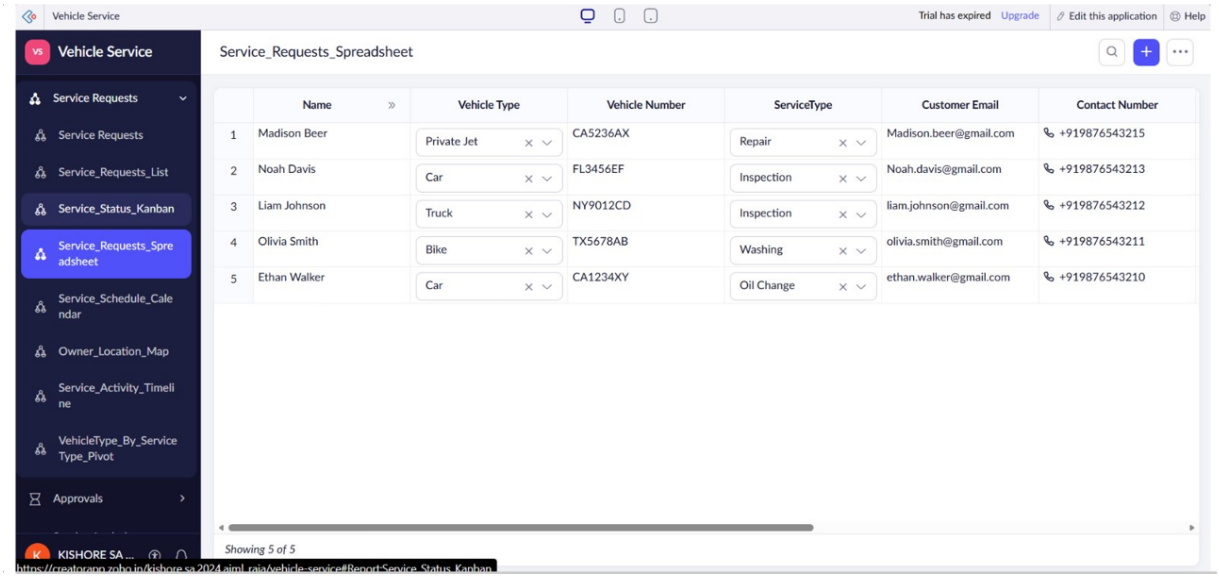

Figure 4: Service_Requests_Spreadsheet report

3.4 Service_Schedule_Calendar

The calendar report plots requests by service date. The screenshot shows the month view for October 2026, with the current day highlighted.

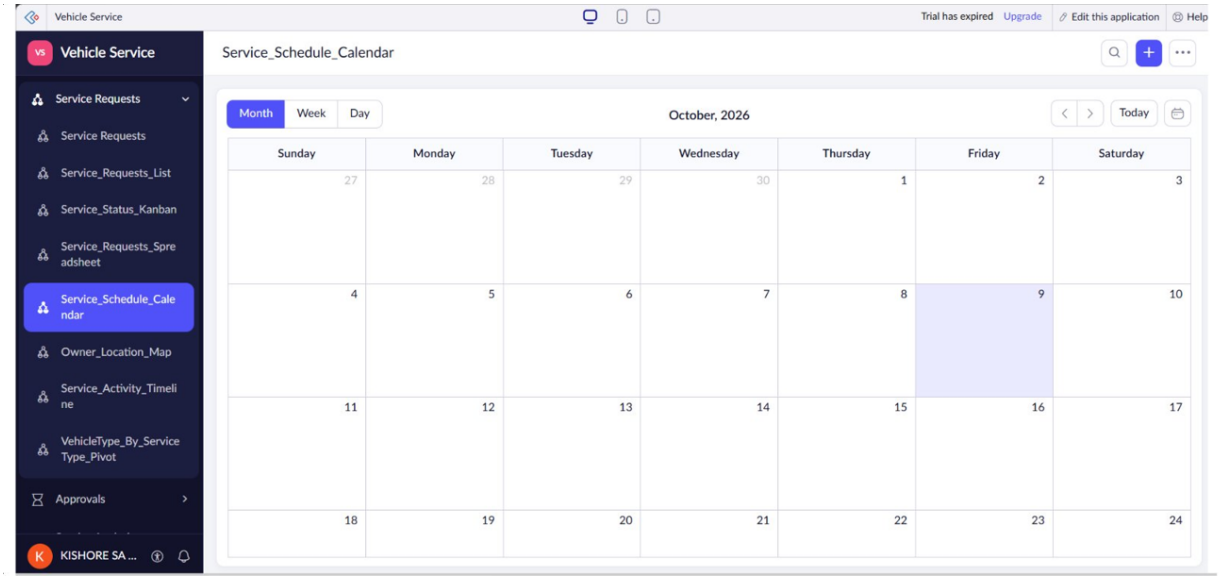

Figure 5: Service_Schedule_Calendar (October 2026)

3.5 Owner_Location_Map

The map report plots owner locations from the address field. The view is centred on the Chennai region of Tamil Nadu and neighbouring areas such as Vellore, Kanchipuram and Tirupati.

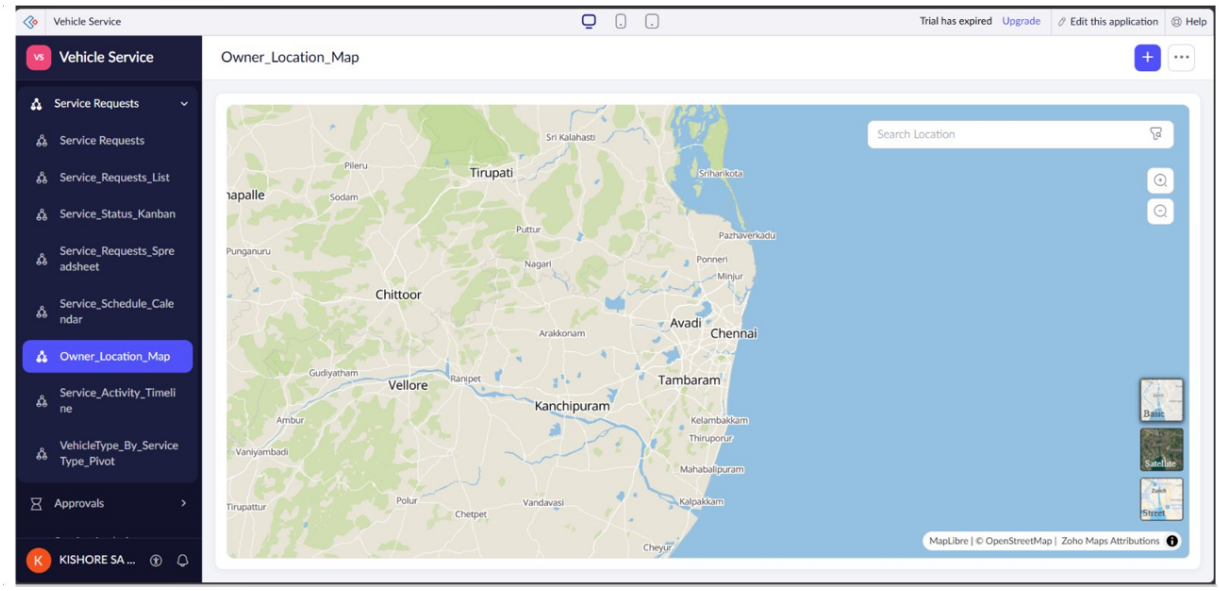

Figure 6: Owner_Location_Map report

3.6 Service_Activity_Timeline

The timeline report lays service activity along hours of the day. The screenshot shows the week view for 4 to 10 October 2026.

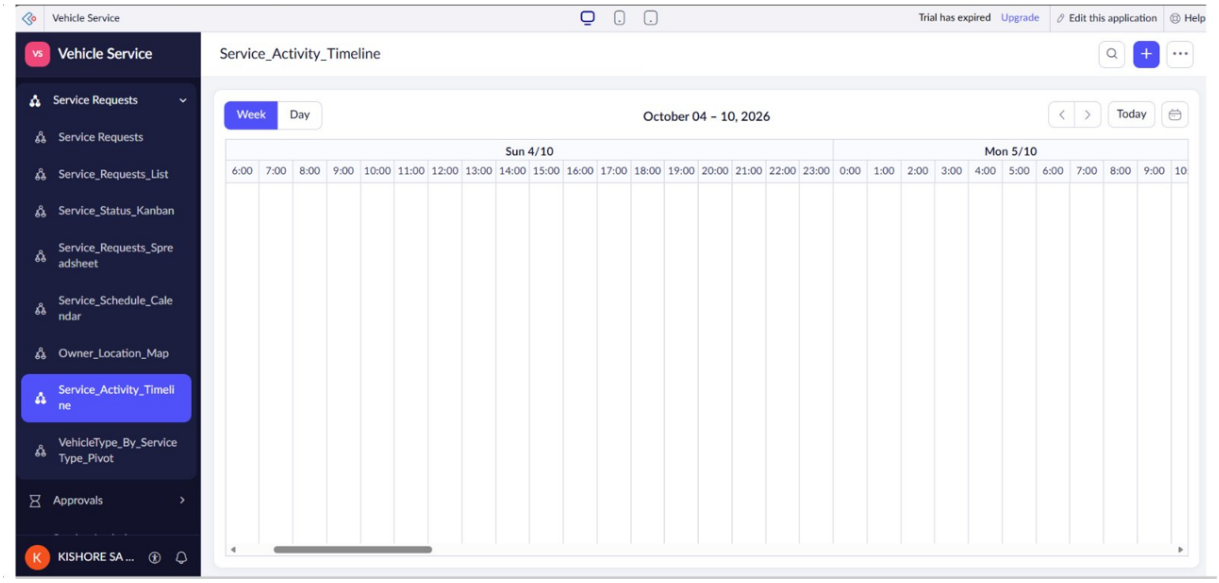

Figure 7: Service_Activity_Timeline report

3.7 VehicleType_By_Service Type_Pivot

The pivot report counts requests by vehicle type (rows) against service type (columns: Inspection, Oil Change, Repair, Washing), with a grand count of 5 requests.

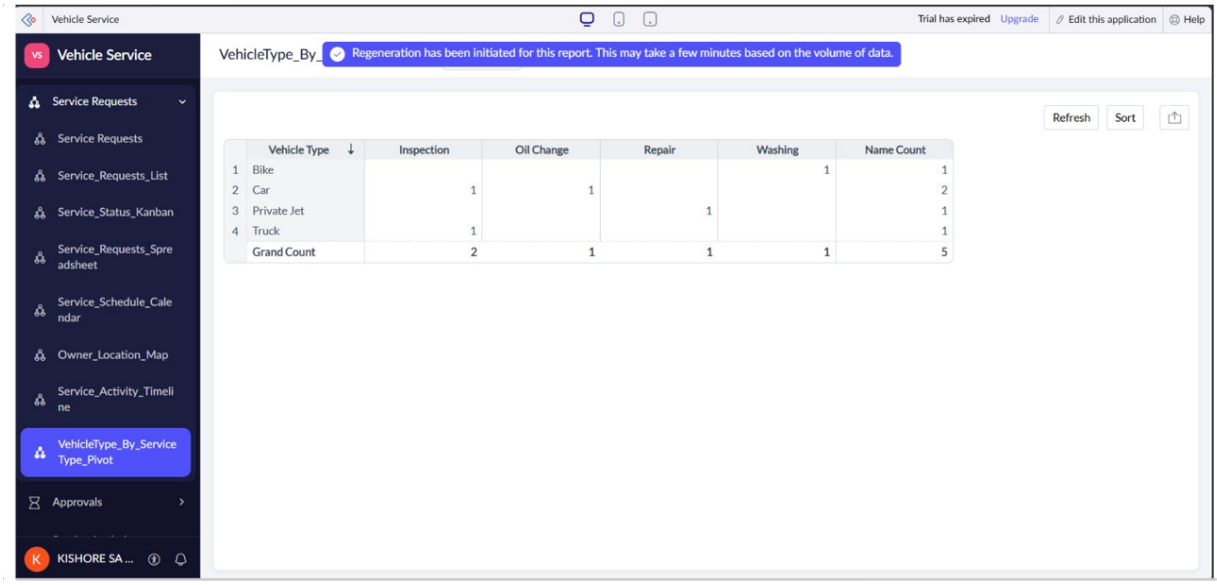

Figure 8: VehicleType_By_Service Type_Pivot report

3.8 Manager_Dashboard

The dashboard presents the headline numbers for the manager: **5** total requests, **2** in progress and an average odometer of 273,200.00, together with a pie chart of requests by service type (Repair, Oil Change, Washing, Inspection). The same pie chart is the basis of the ServiceType_Distribution_Chart_Widget on the Command Center page.

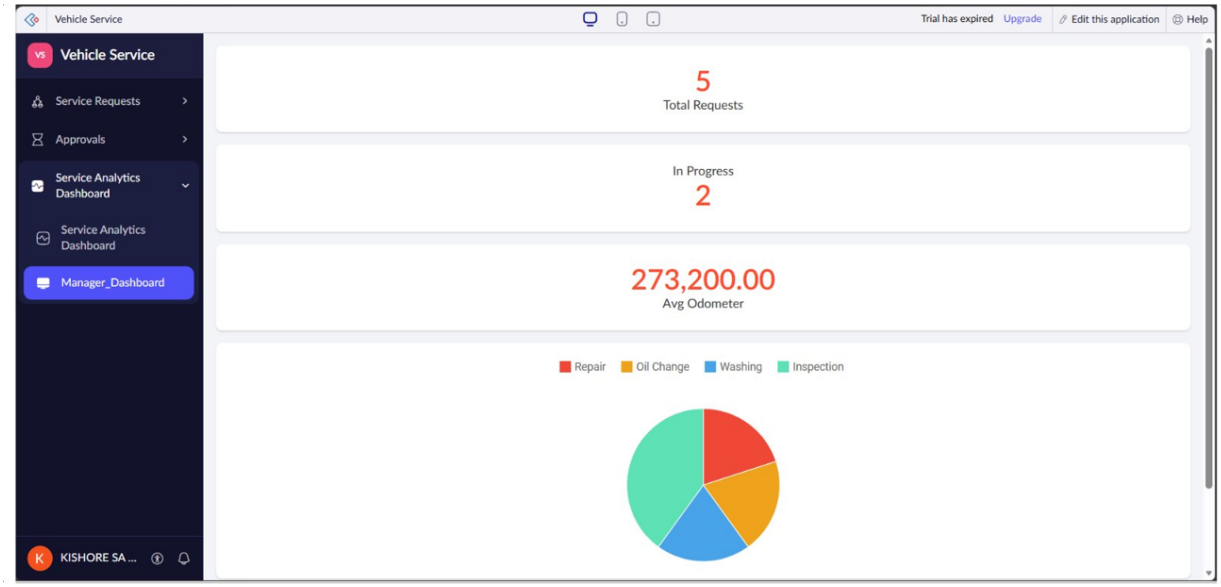

Figure 9: Manager_Dashboard with total requests, in-progress count, average odometer and service-type pie chart

3.9 Service_Status_Kanban

The Kanban report groups cards by the Status field: **Pending** (Noah Davis), **In Progress** (Liam Johnson, Madison Beer) and **Completed** (Ethan Walker, Olivia Smith). The Board element on the Command Center page works the same way, with columns mapped to Status values; to match the assignment its columns are extended to Requested, In Diagnosis, In Repair, Ready for Pickup and Delivered.

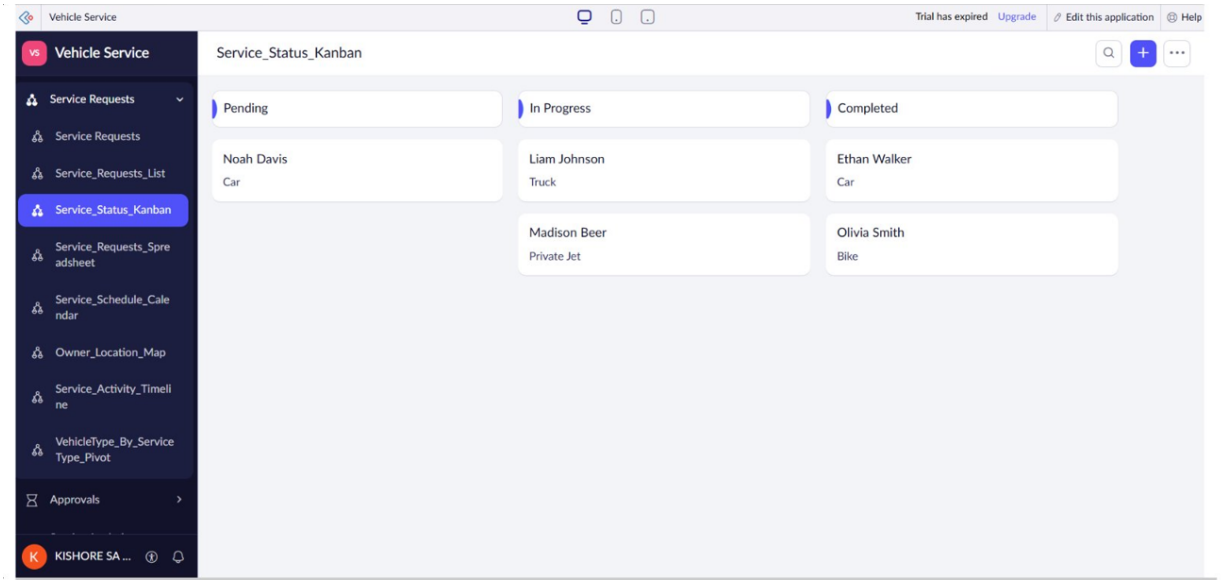

Figure 10: Service_Status_Kanban report

4. Service_Command_Center_Page

4.1 Page layout

Section	Elements
1. Overview strip	Daily Bay Utilization Gauge, ServiceType Distribution Chart, Vehicle/Owner Search Bar
2. Processing workspace	Send Ready-for-Pickup Button, Service Status Board
3. Detailed data	Full Service Requests Report
4. Reference and quick actions (sidebar)	Service Policy Estimate Snippet, Insurance Damage Photo Viewer, Quick Walk-in Service Form (expandable tab)
5. Operations strip	Technician Availability and Spare Parts Stock Widgets

All five sections sit inside **Command_Center_Main_Panel**, the single Panel wrapping the page.

4.2 Configuration and access rules

Element	Rule applied
Panel	Role-based visibility: only front-office and manager accounts can open the page
Board	Each column mapped to a Status value; dragging a card updates the record instantly
Chart	Auto-refresh at a fixed interval so the service-type mix is always current
Gauge	Total bay count configurable per center; colour changes from green to red as bays fill
Search	Searches registration number, owner name and service request ID together
Form	Same validation rules as the standard Service Requests form
Report	Export to Excel restricted to manager-level accounts
Snippets	Centrally managed; edits reflect everywhere the snippet is reused
Button	Notifies only owners whose Status is Ready for Pickup
Widgets	Technician availability refreshes in real time; stock pulled from current inventory
Viewer	Shows the latest uploaded insurance copy or damage photo without manual link updates

4.3 Sample logic for the Send_ReadyForPickup_Button

The button calls a function that notifies only the owners whose requests are marked Ready for Pickup. This is a sample; adjust field and form names to your application.

```
void Notify_ReadyForPickup()
{
    ready = Service_Requests[Status == "Ready for Pickup"];
    for each r in ready
    {
        if(r.Customer_Email != null)
        {
            sendmail
            [
                from: zoho.adminuserid
                to: r.Customer_Email
                subject: "Your vehicle is ready for pickup"
                message: "Dear " + r.Name + ", your vehicle " + r.Vehicle_Number + " is ready."
            ]
        }
    }
}
```

5. Workflow Summary

Step	What happens	Element
1	Staff open the page and check bay occupancy and service-type mix	Gauge, Chart
2	A specific vehicle is found through the search bar instead of scrolling	Search
3	Technicians drag cards across the board as work progresses	Board
4	Staff click the button to notify owners of ready vehicles	Button
5	Walk-in vehicles are logged directly from the page	Form
6	The manager scrolls to the full report for analysis and export	Report
7	Policy questions use the snippet; stock and evidence use the widgets and viewer	Snippets, Widgets, Viewer

6. Learning Outcomes

- Each Page Builder element has a specific role, and together they form one operational dashboard.
- Forms and reports combine with visual elements (Chart, Gauge, Board) in one page.
- Search makes large vehicle and owner datasets quickly navigable.
- Snippets keep content consistent across pages, forms and invoices.
- Widgets and the Viewer add supporting media and reference documents.

7. Evidence Checklist for Submission

The assignment asks for four kinds of evidence. This table shows what this record already contains and what still needs to be captured from the Page Builder.

Required evidence	Status in this record
(a) Full page in the Page Builder with all elements labeled	To add: screenshot of Service_Command_Center_Page in the editor with the eleven elements labeled
(b) Gauge and Chart showing live sample data	Partly included: the service-type pie chart appears on Manager_Dashboard (Fig. 9). To add: Gauge and Chart as placed on the page
(c) Board drag-and-drop with before/after screenshots	Partly included: Service_Status_Kanban (Fig. 10). To add: before and after screenshots of dragging a card
(d) Viewer displaying an insurance copy or damage photo	To add: screenshot of the Viewer with a sample file

8. Conclusion

The reports, dashboard and Command Center page bring monitoring, searching, processing and reference material into one screen. Staff no longer move between separate reports and paper registers, and the manager gets a live view of workload, service mix and stock from a single page.
